What's New In?

Rin'G is an environment for the study and implementation of Graph Theory algorithms that allows users to view interactive, step-by-step animations of their executions. Users can draw graphs on a graphical user interface, load and save graphs and animations and add their own algorithms to be executed. The environment is being developed in Java, for desktop platforms, and uses state-of-the-art technology, such as advanced Swing programming, Design Patterns, and the java.lang.reflect API. Give Rin'G a try to see how useful it can be for you! History: 04.04.2006 - First public version. 05.04.2006 - Added support for graphs with more than 10^6 vertices. 06.04.2006 - Fixed a bug that prevented users from deleting the internal graphs. 06.04.2006 - Added the ability to set up a project to contain the graph library, library projects and graphs to be imported. 13.04.2006 - Added the ability to import graphs from a plain text file. 20.04.2006 - Added the ability to generate a graph of an arbitrary size. 01.05.2006 - Added the ability to create graphs from an XSD file. 05.05.2006 - Added the ability to view graphs in a tree-like structure. 07.05.2006 - Added the ability to view graph blocks (see layout.png) Getting Rin'G ----------------- Getting Rin'G can be done directly from the site, or from the main page. You can download the latest version of Rin'G from the site. Building Rin'G --------- ------- Installing Rin'G is a matter of unzipping a tar file in the directory of your choice. After unzipping Rin'G, simply run the main file, which is located in the root directory. It is strongly recommended that you install Rin'G in a directory where you do not have permissions to write, which means having the folder itself writeable only for your user account. Using Rin'G ------------ To start working with Rin'G, create a new project by selecting New from the menu, selecting Rin'G Project and then following the instructions in the screen. You will find a number of example projects at the same level in the project directory, or you can import a project. Once the project has been created, you can add new graphs, imports, algorithms and layouts by double clicking on the relevant item in the main window. The project will be saved as a file named project.RinG. RTS ---- Once you have created your project, you can run it by selecting Rin'G from the menu and then selecting Run
